

Connected for the Future.

Supplier Relationship Management.

PartnerWorkstation (PAP). Factsheet.

Brief description.

The partner workstation (PAP) is a software package that provides direct access to the product data management system PRISMA, which offers a digital drawing archive (DZA) and technical rules (TEREG). The PAP is designed to provide efficient support for the development process by ensuring better integration of partner companies in processes of the BMW Group.

Possible applications.

External target group: engineering & development partners

The partner workstation (PAP) is used by strategic partners of the BMW Group for design and development (e.g. cross-company motor projects, electric/electronic projects). In particular, for partner companies that carry out vehicle projects externally, the PAP is indispensable ("design in context").

Features.

- Link to the PRISMA client at the partner company.
- Access to the vehicle structure needed in the process.
- Ability to exchange data via PRISMA.
- Up-to-date data at all times.
- Access to BMW standards and regulations via TEREK (technical rules).
- Access to digital drawings in DZA for which the user has authorization.
- Expansion options, such as FM-Stüli (Production Resource Parts List (FM-Stüli), and/or iTMS (Integrated Parts Management System).

Requirements.

- Direct line (extranet) between the BMW Group and its partner companies.
- Recommendation by the department and purchasing.
- Access to the Partner Portal of the BMW Group.
- QX-Number.

Registration.

In order to use PAP you need first of all the PAP role in the portal. It is the master administrator of the external company who has to apply for this role for the user in the b2b user management (function area "Development").

The further application for PAP is done by the user himself in the connection management system (ANABA). The user receives an e-mail explaining the necessary steps.

After the application process has been concluded, the PAP software can be downloaded in the portal and then be used (can be called up only after login).
